## Part II – Quantum Solid State Physics

The LCAO states are a good approximation to the actual electron eigenstates of coupled quantum well and covalently bound atomic systems.

- Write the Hamiltonian in the LCAO basis
- Write the eigenstates in LCAO basis (each  $k$  value  $\rightarrow$  one eigenstate)
- Draw and predict the energy dispersion relations
- Know how to fill the bands with electrons, decide if a material is insulator, semiconductor or metal
- Discuss allowed optical processes
- Bloch's theorem
- Effective mass
- Density of states
