VPP-4.3.2: VISA Implementation Specification for Textual Languages

April 14, 2008

Revision 4.1

Systems Alliance

VPP-4.3.2 Revision History

This section is an overview of the revision history of the VPP-4.3.2 specification.

Revision 1.0, December 29, 1995

Original VISA document. Changes from VISA Transition Library include bindings for locking, asynchronous I/O, 32-bit register access, block moves, shared memory operations, and serial interface support.

Revision 1.1, January 22, 1997

Added new attributes, error codes, events, and formatted I/O modifiers.

Revision 2.0, December 5, 1997

Added error handling event, more formatted I/O operations, more serial attributes and extended searching capabilities. Changed ANSI C representation of attribute and event constants from ending in "L" to "UL" because they are all unsigned values.

Revision 2.0.1, December 4, 1998

Added new types to visatype.h for instrument drivers. Added new modes to give more robust functionality to viGpibControlREN. Updated information regarding contacting the Alliance.

Revision 2.2, November 19, 1999

Added new resource classes for GPIB (INTFC and SERVANT), VXI (BACKPLANE and SERVANT), and TCPIP (INSTR, SOCKET, and SERVANT).

Revision 3.0 Draft, January 14, 2003

Added new resource class for USB (INSTR). Removed definitions for the obsolete WIN framework (Windows 3.x), but this does not preclude a vendor implementation of VISA 3.0 on that framework.

Revision 3.0, January 15, 2004

Approved at IVI Board of Directors meeting.

Revision 4.0 Draft, May 16, 2006

Added new resource class for PXI (INSTR) to incorporate PXISA extensions. Added 64-bit extensions for register-based operations. Added support for WIN64 framework.

Revision 4.0, October 12, 2006

Approved at IVI Board of Directors meeting.

Revision 4.1, February 14, 2008

Updated the introduction to reflect the IVI Foundation organization changes. Replaced Notice with text used by IVI Foundation specifications.

Revision 4.1, April 14, 2008

Editorial change to update the IVI Foundation contact information in the Important Information section to remove obsolete address information and refer only to the IVI Foundation web site.

NOTICE

VPP-4.3.2: *VISA Implementation Specification for Textual Languages* is authored by the IVI Foundation member companies. For a vendor membership roster list, please visit the IVI Foundation web site at www.ivifoundation.org.

The IVI Foundation wants to receive your comments on this specification. You can contact the Foundation through the web site at www.ivifoundation.org.

Warranty

Section 1 Introduction to the VXIplug&play Systems Alliance and the IVI Foundation

The VXIplug&play Systems Alliance was founded by members who shared a common commitment to end-user success with open, multivendor VXI systems. The alliance accomplished major improvements in ease of use by endorsing and implementing common standards and practices in both hardware and software, beyond the scope of the VXIbus specifications. The alliance used both formal and de facto standards to define complete system frameworks. These standard frameworks gave end-users "plug & play" interoperability at both the hardware and system software level.

The IVI Foundation is an organization whose members share a common commitment to test system developer success through open, powerful, instrument control technology. The IVI Foundation's primary purpose is to develop and promote specifications for programming test instruments that simplify interchangeability, provide better performance, and reduce the cost of program development and maintenance.

In 2002, the VXIplug&play Systems Alliance voted to become part of the IVI Foundation. In 2003, the VXIplug&play Systems Alliance formally merged into the IVI Foundation. The IVI Foundation has assumed control of the VXIplug&play specifications, and all ongoing work will be accomplished as part of the IVI Foundation.

All references to VXIplug&play Systems Alliance within this document, except contact information, were maintained to preserve the context of the original document.

Section 2 Overview of VISA Implementation Specification

This section introduces the VISA Implementation Specification for Textual Languages. This specification is a document authored by the *VXIplug&play* Systems Alliance. The technical work embodied in this document and the writing of this document was performed by the VISA Technical Working Group.

This section provides a complete overview of the VISA implementation specification, and gives readers general information that may be required to understand how to read, interpret, and implement individual aspects of this specification. This section is organized as follows:

- Objectives of this specification
- Audience for this specification
- Scope and organization of this specification
- Application of this specification
- References
- Definitions of terms and acronyms
- Conventions
- Communication

2.1 Objectives of This Specification

VISA gives VXI and GPIB software developers, particularly instrument driver developers, the functionality needed by instrument drivers in an interface-independent fashion for MXI, embedded VXI, GPIB-VXI, GPIB, and asynchronous serial controllers. *VXIplug&play* drivers written to the VISA specifications can execute on *VXIplug&play* system frameworks that have the VISA I/O library.

The VISA specification provides a common standard for the *VXIplug&play* System Alliance for developing multi-vendor software programs, including instrument drivers. This specification describes the VISA software model and the VISA Application Programming Interface (API).

The VISA Implementation Specification for Textual Languages addresses particular issues related to implementing source and binary level compatibility within specific frameworks, for the C and BASIC languages. Implementation issues for the G language are described in VPP-4.3.3: *VISA Implementation Specification for the G Language*.

2.2 Audience for This Specification

There are three audiences for this specification. The first audience is instrument driver developers—whether an instrument vendor, system integrator, or end user—who want to implement instrument driver software that is compliant with the *VXIplug&play* standards. The second audience is I/O vendors who want to implement VISA-compliant I/O software. The third audience is instrumentation end users and application programmers who want to implement applications that utilize instrument drivers compliant with this specification.

2.3 Scope and Organization of This Specification

This specification is organized in sections, with each section discussing a particular aspect of the VISA model.

Section 1 explains the VXI*plug&play* Systems Alliance and its relation to the IVI Foundation.

Section 2 provides an overview of this specification, including the objectives, scope and organization, application, references, definition of terms and acronyms, and conventions.

Section 3 provides the details of the VISA bindings to specific frameworks.

2.4 Application of This Specification

This specification is intended for use by developers of VXI*plug&play* instrument drivers and by developers of VISA I/O software. It is also useful as a reference for end users of VXI*plug&play* instrument drivers. This specification is intended to be used in conjunction with the VPP-3.x specifications, including the *Instrument Drivers Architecture and Design Specification* (VPP-3.1), the *Instrument Driver Functional Body Specification* (VPP-3.2), the *Instrument Interactive Developer Interface Specification* (VPP-3.3), and the *Instrument Driver Programmatic Developer Interface Specification* (VPP-3.4). These related specifications describe the implementation details for specific instrument drivers that are used with specific system frameworks. VXI*plug&play* instrument drivers developed in accordance with these specifications can be used in a wide variety of higher-level software environments, as described in the *System Frameworks Specification* (VPP-2).

2.6 Definition of Terms and Acronyms

The following are some commonly used terms within this document

Address	A string (or other language construct) that uniquely locates and identifies a resource. VISA defines an ASCII-based grammar that associates strings with particular physical devices or interfaces and VISA resources.
ADE	Application Development Environment
API	Application Programmers Interface. The direct interface that an end user sees when creating an application. The VISA API consists of the sum of all of the operations, attributes, and events of each of the VISA Resource Classes.
Attribute	A value within a resource that reflects a characteristic of the operational state of a resource.
Bus Error	An error that signals failed access to an address. Bus errors occur with low-level accesses to memory and usually involve hardware with bus mapping capabilities. For example, non-existent memory, a non-existent register, or an incorrect device access can cause a bus error.
Commander	A device that has the ability to control another device. This term can also denote the unique device that has sole control over another device (as with the VXI Commander/Servant hierarchy).
Communication Channel	The same as <i>Session</i> . A communication path between a software element and a resource. Every communication channel in VISA is unique.

Controller	A device that can control another device(s) or is in the process of performing an operation on another device.
Device	An entity that receives commands from a controller. A device can be an instrument, a computer (acting in a non-controller role), or a peripheral (such as a plotter or printer). In VISA, the concept of a device is generally the logical association of several VISA resources.
Instrument	A device that accepts some form of stimulus to perform a designated task, test, or measurement function. Two common forms of stimuli are message passing and register reads and writes. Other forms include triggering or varying forms of asynchronous control.
Interface	A generic term that applies to the connection between devices and controllers. It includes the communication media and the device/controller hardware necessary for cross-communication.
Instrument Driver	Library of functions for controlling a specific instrument
Mapping	An operation that returns a reference to a specified section of an address space and makes the specified range of addresses accessible to the requester. This function is independent of memory allocation.
Operation	An action defined by a resource that can be performed on a resource.
Process	An operating system component that shares a system's resources. A multi-process system is a computer system that allows multiple programs to execute simultaneously, each in a separate process environment. A single-process system is a computer system that allows only a single program to execute at a given point in time.
Register	An address location that either contains a value that is a function of the state of hardware or can be written into to cause hardware to perform a particular action or to enter a particular state. In other words, an address location that controls and/or monitors hardware.
Resource Class	The definition for how to create a particular resource. In general, this is synonymous with the connotation of the word <i>class</i> in object-oriented architectures. For VISA Instrument Control Resource Classes, this refers to the definition for how to create a resource that controls a particular capability of a device.
Resource or Resource Instance	In general, this term is synonymous with the connotation of the word <i>object</i> in object-oriented architectures. For VISA, <i>resource</i> more specifically refers to a particular implementation (or <i>instance</i> in object-oriented terms) of a Resource Class. In VISA, every defined software module is a resource.
Session	The same as <i>Communication Channel</i> . A communication path between a software element and a resource. Every communication channel in VISA is unique.

SRQ	IEEE 488 Service Request. This is an asynchronous request from a remote GPIB device that requires service. A service request is essentially an interrupt from a remote device. For GPIB, this amounts to asserting the SRQ line on the GPIB. For VXI, this amounts to sending the Request for Service True event (REQT).
Status Byte	A byte of information returned from a remote device that shows the current state and status of the device. If the device follows IEEE 488 conventions, bit 6 of the status byte indicates if the device is currently requesting service.
Template Function	Instrument driver subsystem function common to the majority of <i>VXIplug&play</i> instrument drivers
Top-level Example	A high-level test-oriented instrument driver function. It is typically developed from the instrument driver subsystem functions.
Virtual Instrument	A name given to the grouping of software modules (in this case, VISA resources with any associated or required hardware) to give the functionality of a traditional stand-alone instrument. Within VISA, a virtual instrument is the logical grouping of any of the VISA resources. The VISA Instrument Control Resources Organizer serves as a means to group any number of any type of VISA Instrument Control Resources within a VISA system.
VISA	Virtual Instrument Software Architecture. This is the general name given to this document and its associated architecture. The architecture consists of two main VISA components: the VISA Resource Manager and the VISA Instrument Control Resources.
VISA Instrument Control Resources	This is the name given to the part of VISA that defines all of the device-specific resource classes. VISA Instrument Control Resources encompass all defined device and interface capabilities for direct, low-level instrument control.
VISA Resource Manager	This is the name given to the part of VISA that manages resources. This management includes support for opening, closing, and finding resources; setting attributes, retrieving attributes, and generating events on resources; and so on.
VISA Resource Template	This is the name given to the part of VISA that defines the basic constraints and interface definition for the creation and use of a VISA resource. All VISA resources must derive their interface from the definition of the VISA Resource Template.

2.7 Conventions

Throughout this specification you will see the following headings on certain paragraphs. These headings instill special meaning on these paragraphs.

Rules must be followed to ensure compatibility with the System Framework. A rule is characterized by the use of the words **SHALL** and **SHALL NOT** in bold upper case characters. These words are not used in this manner for any other purpose other than stating rules.

Recommendations consist of advice to implementors which will affect the usability of the final device. They are included in this standard to draw attention to particular characteristics which the authors believe to be important to end user success.

Permissions are included to *authorize* specific implementations or uses of system components. A permission is characterized by the use of the word **MAY** in bold upper case characters. These permissions are granted to ensure specific System Framework components are well defined and can be tested for compatibility and interoperability.

Observations spell out implications of rules and bring attention to things that might otherwise be overlooked. They also give the rationale behind certain rules, so that the reader understands why the rule must be followed.

A note on the text of the specification: Any text which appears without heading should be considered as description of the standard and how the architecture was intended to operate. The purpose of this text is to give the reader a deeper understanding of the intentions of the specification including the underlying model and specific required features. As such, the implementor of this standard should take great care to ensure that a particular implementation does not conflict with the text of the standard.

Section 3 VISA Textual Language Bindings

3.1 Type Assignments

Tables 3.1.1 and 3.1.2 give the type assignments for ANSI C and Visual Basic for each type defined in VPP-4.3. Although ANSI C types can be defined in a header file, Visual Basic types cannot. Table 3.1.1 lists those types that are both used and exported by direct users of VISA (such as instrument drivers). Table 3.1.2 lists types that may be used but not exported by such users. For example, end-users would see the types specified in Table 3.1.1 exported by the instrument driver; however, they would not see the types specified in Table 3.1.2.

Table 3.1.1. Type Assignments for VISA and Instrument Drivers

VISA Data Type	ANSI C Binding	Visual Basic Binding	Description
ViUInt32	unsigned long	Long	A 32-bit unsigned integer.
ViPUInt32	ViUInt32 *	N/A	The location of a 32-bit unsigned integer.
ViAUInt32	ViUInt32[]	N/A	An array of 32-bit unsigned integers.
ViInt32	signed long	Long	A 32-bit signed integer.
ViPInt32	ViInt32 *	N/A	The location of a 32-bit signed integer.
ViAInt32	ViInt32[]	N/A	An array of 32-bit signed integers.
ViUInt64	Unsigned int64 or u_int64_t	N/A	A 64-bit unsigned integer. The exact type definition depends on the compiler.
ViPUInt64	ViUInt64 *	N/A	The location of a 64-bit unsigned integer.
ViAUInt64	ViUInt64[]	N/A	An array of 64-bit unsigned integers.
ViInt64	signed int64 or int64_t	N/A	A 64-bit signed integer. The exact type definition depends on the compiler.
ViPInt64	ViInt64 *	N/A	The location of a 64-bit signed integer.
ViAInt64	ViInt64[]	N/A	An array of 64-bit signed integers.
ViUInt16	unsigned short	Integer	A 16-bit unsigned integer.
ViPUInt16	ViUInt16 *	N/A	The location of a 16-bit unsigned integer.
ViAUInt16	ViUInt16[]	N/A	An array of 16-bit unsigned integers.
ViInt16	signed short	Integer	A 16-bit signed integer.
ViPInt16	ViInt16 *	N/A	The location of a 16-bit signed integer.
ViAInt16	ViInt16[]	N/A	An array of 16-bit signed integers.
ViUInt8	unsigned char	Integer/ Byte	An 8-bit unsigned integer.
ViPUInt8	ViUInt8 *	N/A	The location of an 8-bit unsigned integer.
ViAUInt8	ViUInt8[]	N/A	An array of 8-bit unsigned integers.

(continues)

Table 3.1.1. Type Assignments for VISA and Instrument Drivers (Continued)

VISA Data Type	ANSI C Binding	Visual Basic Binding	Description
ViInt8	signed char	Integer/ Byte	An 8-bit signed integer.
ViPInt8	ViInt8 *	N/A	The location of an 8-bit signed integer.
ViAInt8	ViInt8[]	N/A	An array of 8-bit signed integers.
ViAddr	void *	Long	A type that references another data type, in cases where the other data type may vary depending on a particular context.
ViPAddr	ViAddr *	N/A	The location of a ViAddr.
ViAAddr	ViAddr[]	N/A	An array of type ViAddr.
ViChar	char	Integer/ Byte	An 8-bit integer representing an ASCII character.
ViPChar	ViChar *	N/A	The location of a ViChar.
ViAChar	ViChar[]	N/A	An array of type ViChar.
ViByte	unsigned char	Integer/ Byte	An 8-bit unsigned integer representing an extended ASCII character.
ViPByte	ViByte *	N/A	The location of a ViByte.
ViAByte	ViByte[]	N/A	An array of type ViByte.
ViBoolean	ViUInt16	Integer	A type for which there are two complementary values: VI_TRUE and VI_FALSE.
ViPBoolean	ViBoolean *	N/A	The location of a ViBoolean.
ViABoolean	ViBoolean[]	N/A	An array of type ViBoolean.
ViReal32	float	Single	A 32-bit single-precision value.
ViPReal32	ViReal32 *	N/A	The location of a 32-bit single-precision value.
ViAReal32	ViReal32[]	N/A	An array of 32-bit single-precision values.
ViReal64	double	Double	A 64-bit double-precision value.
ViPReal64	ViReal64 *	N/A	The location of a 64-bit double-precision value.
ViAReal64	ViReal64[]	N/A	An array of 64-bit double-precision values.
ViBuf	ViPByte	String	The location of a block of data.
ViPBuf	ViPByte	String	The location to store a block of data.
ViABuf	ViBuf[]	N/A	An array of type ViBuf.
ViString	ViPChar	String	The location of a NULL-terminated ASCII string.
ViPString	ViPChar	String	The location to store a NULL-terminated ASCII string.
ViAString	ViString[]	N/A	An array of type ViString.

(continues)

Table 3.1.1. Type Assignments for VISA and Instrument Drivers (Continued)

VISA Data Type	ANSI C Binding	Visual Basic Binding	Description
ViRsrc	ViString	String	A ViString type that is further restricted to adhere to the addressing grammar for resources as presented in Section 3 of VPP-4.3.
ViPRsrc	ViString	String	The location to store a ViRsrc.
ViARsrc	ViRsrc[]	N/A	An array of type ViRsrc.
ViStatus	ViInt32	Long	A defined type that contains values corresponding to VISA-defined Completion and Error termination codes.
ViPStatus	ViStatus *	N/A	The location of a ViStatus.
ViAStatus	ViStatus[]	N/A	An array of type ViStatus.
ViVersion	ViUInt32	Long	A defined type that contains a reference to all information necessary for the architect to represent the current version of a resource.
ViPVersion	ViVersion *	N/A	The location of a ViVersion.
ViAVersion	ViVersion[]	N/A	An array of type ViVersion.
ViObject	ViUInt32	Long	The most fundamental VISA data type. It contains attributes and can be closed when no longer needed.
ViPObject	ViObject *	N/A	The location of a ViObject.
ViAObject	ViObject[]	N/A	An array of type ViObject.
ViSession	ViObject	Long	A defined type that contains a reference to all information necessary for the architect to manage a communication channel with a resource.
ViPSession	ViSession *	N/A	The location of a ViSession.
ViASession	ViSession[]	N/A	An array of type ViSession.
ViAttr	ViUInt32	Long	A type that uniquely identifies an attribute.
ViConstString	const ViChar *	String	A ViString type that is guaranteed to not be modified by any driver.

OBSERVATION 3.1.1

Table 3.1.1 lists each fundamental data type, a second type that is a reference to the fundamental data type, and a third type that indicates an array of the fundamental data type. For example, the entry ViUInt32, at the beginning of Table 3.1.1, is a fundamental data type. Fundamental data types are used for variable declarations and input parameters. ViPUInt32 is a reference to a ViUInt32, and is used for output parameters of type ViUInt32. ViAUInt32 is used for both input and output parameters of arrays of type ViUInt32.

OBSERVATION 3.1.2

In the case of Visual Basic, input parameters are passed by value (ByVal). Output parameters are not passed by value except for string types. For arrays, the first element of the array should be passed by reference. For example, to pass an array x, use x(0).

Table 3.1.2. Type Assignments for VISA Only

VISA Data Type	ANSI C Binding	Visual Basic Binding	Description
ViAccessMode	ViUInt32	Long	A defined type that specifies the different mechanisms that control access to a resource.
ViPAccessMode	ViAccessMode *	N/A	The location of a ViAccessMode.
ViBusAddress	ViUInt32 or ViUInt64	Long or N/A	A type that represents the system-dependent physical address. This varies on 32-bit and 64-bit systems.
ViBusAddress64	ViUInt64	N/A	A type that represents a physical address that is always 64 bits, even on 32-bit systems.
ViPBusAddress	ViBusAddress *	N/A	The location of a ViBusAddress.
ViPBusAddress64	ViBusAddress64 *	N/A	The location of a ViBusAddress64.
ViBusSize	ViUInt32 or ViUInt64	Long or N/A	A type that represents the system dependent physical address size. This varies on 32-bit and 64-bit systems.
ViAttrState	ViUInt32 or ViUInt64	Long or N/A	A value unique to the individual type of an attribute. This varies on 32-bit and 64-bit systems.
ViPAttrState	void *	Any	The location of a ViAttrState.
ViVAlList	va_list	Any	The location of a list of a variable number of parameters of differing types.
ViEventType	ViUInt32	Long	A defined type that uniquely identifies the type of an event.
ViPEventType	ViEventType *	N/A	The location of a ViEventType.
ViAEventType	ViEventType *	N/A	An array of type ViEventType.
ViPAttr	ViAttr *	N/A	The location of a ViAttr.
ViAAttr	ViAttr *	N/A	An array of type ViAttr.
ViEventFilter	ViUInt32	Long	A defined type that specifies filtering masks or other information unique to an event.
ViFindList	ViObject	Long	A defined type that contains a reference to all resources found during a search operation.
ViPFindList	ViFindList *	N/A	The location of a ViFindList.
ViEvent	ViObject	Long	A defined type that encapsulates the information necessary to process an event.
ViPEvent	ViEvent *	N/A	The location of a ViEvent.
ViKeyId	ViString	String	A defined type that contains a reference to all information necessary for the architect to manage the association of a thread or process and session with a lock on a resource.

(continues)

Table 3.1.2. Type Assignments for VISA Only (Continued)

VISA Data Type	ANSI C Binding	Visual Basic Binding	Description
ViPKeyId	ViPString	String	The location of a ViKeyId.
ViJobId	ViUInt32	Long	A defined type that contains a reference to all information necessary for the architect to encapsulate the information necessary for a posted operation request.
ViPJobId	ViJobId *	N/A	The location of a ViJobId.
ViHndlr	ViStatus (*) (ViSession, ViEventType, ViEvent, ViAddr)	N/A	A value representing an entry point to an operation for use as a callback.

OBSERVATION 3.1.3

The pointer type `ViHndlr` is a code pointer rather than a data pointer. Therefore, it must be treated differently in some frameworks.

RULE 3.1.1

All types in Tables 3.1.1 and 3.1.2 **SHALL** be defined to the specified bindings.

RULE 3.1.2

All ANSI C definitions in Table 3.1.1 **SHALL** be present within the `visatype.h` file.

RULE 3.1.3

All ANSI C definitions in Table 3.1.2 **SHALL** be present within the `visa.h` file.

3.1.1 Type Assignments for WINNT Framework**RULE 3.1.4**

Unless otherwise stated, all pointers in Tables 3.1.1 and 3.1.2 **SHALL** be treated as flat 32-bit data pointers when interfacing to the WINNT Framework DLL.

RULE 3.1.5

The pointer type `ViHndlr` **SHALL** be treated as a `_stdcall` pointer when interfacing to the WINNT Framework DLL.

3.1.2 Type Assignments for WIN64 Framework

NOTE: The definition of the WIN64 framework is currently in progress. Version 4.0 of the VISA family of specifications (VPP 4.3) refer to the WIN64 framework being defined in VPP 2 (Frameworks) and VPP 6 (Installation). When the definition of the WIN64 framework in VPP 2 and VPP 6 is complete, it will apply to the VISA 4.0 specifications and these “in progress” notes will be removed as an editorial change.

RULE 3.1.6

Unless otherwise stated, all pointers in Tables 3.1.1 and 3.1.2 **SHALL** be treated as flat 64-bit data pointers when interfacing to the WIN64 Framework DLL.

RULE 3.1.7

The pointer type `ViHndlr` **SHALL** be treated as a `fastcall` pointer when interfacing to the WIN64 Framework DLL.

3.2 Operation Prototypes

The following sections specify the operation prototypes for ANSI C and Visual Basic. Table 3.2.1 gives the function prototypes for the ANSI C bindings for each function and operation in VPP-4.3.

Table 3.2.1. ANSI C Bindings for VISA Operations

ViStatus viGetDefaultRM	(ViPSession sesn);
ViStatus viOpenDefaultRM	(ViPSession sesn);
ViStatus viFindRsrc	(ViSession sesn, ViString expr, ViPFindList findList, ViPUInt32 retCnt, ViChar _VI_FAR desc[]);
ViStatus viFindNext	(ViFindList findList, ViChar _VI_FAR desc[]);
ViStatus viParseRsrc	(ViSession sesn, ViRsrc rsrcName, ViPUInt16 intfType, ViPUInt16 intfNum);
ViStatus viParseRsrcEx	(ViSession sesn, ViRsrc rsrcName, ViPUInt16 intfType, ViPUInt16 intfNum, ViChar VI_FAR rsrcClass[], ViChar VI_FAR expandedUnaliasedName[], ViChar VI_FAR aliasIfExists[]);
ViStatus viOpen	(ViSession sesn, ViRsrc name, ViAccessMode mode, ViUInt32 timeout, ViPSession vi);
ViStatus viClose	(ViObject vi);
ViStatus viGetAttribute	(ViObject vi, ViAttr attrName, void _VI_PTR attrValue);
ViStatus viSetAttribute	(ViObject vi, ViAttr attrName, ViAttrState attrValue);
ViStatus viStatusDesc	(ViObject vi, ViStatus status, ViChar _VI_FAR desc[]);
ViStatus viTerminate	(ViObject vi, ViUInt16 degree, ViJobId jobId);
ViStatus viLock	(ViSession vi, ViAccessMode lockType, ViUInt32 timeout, ViKeyId requestedKey, ViChar _VI_FAR accessKey[]);
ViStatus viUnlock	(ViSession vi);
ViStatus viEnableEvent	(ViSession vi, ViEventType eventType, ViUInt16 mechanism, ViEventFilter context);
ViStatus viDisableEvent	(ViSession vi, ViEventType eventType, ViUInt16 mechanism);
ViStatus viDiscardEvents	(ViSession vi, ViEventType eventType, ViUInt16 mechanism);
ViStatus viWaitOnEvent	(ViSession vi, ViEventType inEventType, ViUInt32 timeout, ViPEventType outEventType, ViPEvent outContext);
ViStatus viInstallHandler	(ViSession vi, ViEventType eventType, ViHndlr handler, ViAddr userHandle);
ViStatus viUninstallHandler	(ViSession vi, ViEventType eventType, ViHndlr handler, ViAddr userHandle);
ViStatus viRead	(ViSession vi, ViPBuf buf, ViUInt32 cnt, ViPUInt32 retCnt);
ViStatus viReadAsync	(ViSession vi, ViPBuf buf, ViUInt32 cnt, ViPJobId jobId);
ViStatus viReadToFile	(ViSession vi, ViConstString filename, ViUInt32 cnt, ViPUInt32 retCnt);
ViStatus viWrite	(ViSession vi, ViBuf buf, ViUInt32 cnt, ViPUInt32 retCnt);

RULE 3.2.1

All functions and operations specified in Table 3.2.1 **SHALL** be implemented as specified.

RULE 3.2.2

The ANSI C definitions in Table 3.2.1 **SHALL** be present within the `visa.h` file.

OBSERVATION 3.2.1

The operations `viPrintf()`, `viScanf()`, and `viQueryf()` take a variable number of arguments, which requires a different calling convention in some frameworks.

3.2.1 Operation Prototypes for WINNT Framework

RULE 3.2.3

Unless otherwise stated, all functions and operations specified in Table 3.2.1 **SHALL** be treated as `_stdcall` when interfacing to the WINNT Framework DLL.

RULE 3.2.4

The operations `viPrintf()`, `viScanf()`, and `viQueryf()` **SHALL** be treated as `_cdecl` when interfacing to the WINNT Framework DLL.

RULE 3.2.5

All pointers in Table 3.2.1 **SHALL** be treated as flat 32-bit pointers when interfacing to the WINNT Framework DLL.

Table 3.2.2 gives the function prototypes for the Visual Basic bindings for each operation in VPP-4.3 for the WINNT framework.

Table 3.2.2. Visual Basic Bindings for VISA Operations for the WINNT Framework

```

RULE 3.2.6

All definitions specified in Table 3.2.2 for the WINNT framework **SHALL** be explicit within the `visa32.bas` file.

3.2.2 Operation Prototypes for WIN64 Framework**RULE 3.2.7**

Unless otherwise stated, all functions and operations specified in Table 3.2.1 **SHALL** be treated as fastcall when interfacing to the WIN64 Framework DLL.

RULE 3.2.8

The operations `viPrintf()`, `viScanf()`, and `viQueryf()` **SHALL** be treated as fastcall when interfacing to the WIN64 Framework DLL.

RULE 3.2.9

All pointers in Table 3.2.1 **SHALL** be treated as flat 64-bit pointers when interfacing to the WIN64 Framework DLL.

3.3 Completion and Error Codes

Table 3.3.1 lists the Completion and Error codes defined for all framework bindings.

RULE 3.3.1

All Completion and Error codes specified in Table 3.3.1 **SHALL** be present in the `visa.h` and `visa32.bas` files.

RULE 3.3.2

The `visa.h` and `visa32.bas` files **SHALL** define all the Completion and Error codes to be the same bit pattern as those in Table 3.3.1.

OBSERVATION 3.3.1

Some ANSI C compilers may generate warnings when comparing signed and unsigned values. Since hexadecimal constants with the most significant bit set may be treated as unsigned values, comparing a variable of type `ViStatus` to any of the error codes could generate a warning. To avoid this situation, it is valid to represent the values in a different way. One example is to use their decimal equivalent (signed), which would normally not generate a warning.

OBSERVATION 3.3.2

Notice that all success and warning codes (Completion codes) have a value that is greater than or equal to 0, while all Error codes have a value that is less than 0. Therefore, an application determines whether an invocation of a given operation fails by checking to see whether the return value is *less than* 0 (as opposed to *not equal to* 0).

3.4 Attribute Values

Table 3.4.1 shows the attribute values used for all framework bindings.

RULE 3.7.2

The WINNT Framework DLL **SHALL** be named `visa32.dll`.

RULE 3.7.3

The WINNT Framework DLL **SHALL** be a 32-bit DLL.

RULE 3.7.4

The WINNT Framework DLL **SHALL** use the exports in the procedure definition file (`visa32.def` file) specified in Table 3.7.1.

RULE 3.7.5

The WIN64 Framework DLL **SHALL** be named `visa64.dll`.

RULE 3.7.6

The WIN64 Framework DLL **SHALL** be a 64-bit DLL.

RULE 3.7.7

The WIN64 Framework DLL **SHALL** use the exports in the procedure definition file (`visa64.def` file) specified in Table 3.7.1.

OBSERVATION 3.7.1

The location where the VISA library is installed is specified in VPP-6.

3.8 Miscellaneous

RULE 3.8.1

Every VISA 4.0 implementation **SHALL** provide the following `#define` in the `visa.h` file:

```
#define VI_SPEC_VERSION (0x00400000UL)
```

RULE 3.8.2

Every VISA 4.0 implementation **SHALL** provide the following constant in the `visa32.bas` file:

```
Global Const VI_SPEC_VERSION = &H00400000&
```

RULE 3.8.3

The default contents (with no user-defined macros enabled) of the compiled or interpreted versions of the `visatype.h`, `visa.h`, and `visa32.bas` files **SHALL** be exactly the same as the compiled or interpreted versions of the corresponding files listed in Appendix A, *Implementation Files*, of this document.

PERMISSION 3.8.1

A vendor **MAY** provide conditionally compiled or interpreted extensions to the `visatype.h`, `visa.h`, and `visa32.bas` files listed in Appendix A, *Implementation Files*, of this document.

PERMISSION 3.8.2

Any vendor-specific extension to the `visatype.h`, `visa.h`, and `visa32.bas` files **MAY** be either binary compatible or non-interoperable.

RULE 3.8.4

Binary-compatible vendor-specific extensions **SHALL** be enabled via a user-defined macro of the form `PREFIX_<extension>`.

RULE 3.8.5

Non-interoperable vendor-specific extensions **SHALL** be enabled via a user-defined macro of the form `PREFIX_NONINTEROP_<extension>`.

RULE 3.8.6

The `PREFIX` used in Rules 3.8.4 and 3.8.5 **SHALL** begin with two characters based on the instrument vendor as defined in VPP-9, *Instrument Vendor Abbreviations*, followed by the characters `VISA`.

OBSERVATION 3.8.1

Rule 3.8.3 through 3.8.6 and Permissions 3.8.1 and 3.8.2 allow for vendor-specific extensions, provided that the default version (with no user-defined macros enabled) compiles to the same output as the files provided in this specification. Rule 3.8.3 provides for multi-vendor interoperability for *VXIplug&play* applications and instrument drivers compiled without user-defined macros.

OBSERVATION 3.8.2

Two examples of a valid PREFIX, as specified in Rule 3.8.6, are NIVISA and HPVISA.

PERMISSION 3.8.3

A vendor **MAY** use either one <extension> user-defined macro to cover all extensions, or a unique <extension> macro for each extension.

OBSERVATION 3.8.3

An example of a non-interoperable extension is the addition of an operation not published in this specification. An application using that operation may behave incorrectly or even fail to run if used with a different vendor's VISA implementation that does not have that operation.

RECOMMENDATION 3.8.1

Non-compatible extensions to the `visatype.h`, `visa.h`, and `visa32.bas` files should provide a warning when such a feature is enabled.

OBSERVATION 3.8.4

Notice that not all compilers or interpreters can produce warning messages.

RULE 3.8.7

IF a vendor-specific extension overrides any operation, attribute, or other feature provided by the VISA specification, **THEN** the vendor providing that extension **SHALL** ensure that the feature is binary compatible with other vendors' implementations of VISA.

RULE 3.8.8

Every VISA implementation **SHALL** follow the VISA installation requirements as listed in VPP-6, *Installation and Packaging Specification*.

Table 3.8.1. Bit Pattern for Attributes

		← 14								← 12			
31	30	29	...	16	15	14	13	12	11	...	0		

Bit 31: Pass by value or by reference

0 = by value

1 = by reference

Bit 30: Reserved (always 0)

Bits 29-16: Manufacturer ID

0-0FFF = VXI defined

1000-3FFF = VXi*plug&play* defined

- 3FFC = instrument drivers

- 3FFF = VISA

Bit 15: Published or internal attribute

0 = published

1 = internal / undocumented

Bit 14: Attribute class association

0 = defined by the VISA template or an individual resource

1 = defined by an event

Bits 13-12: Reserved (always 0)

Bits 11-0: Unique sequence value

Table 3.8.2. Bit Pattern for Status Codes

		← 14								← 12			
31	30	29	...	16	15	14	13	12	11	...	0		

Bit 31: Success or failure

0 = success or warning

1 = error

Bit 30: Reserved (always 0)

Bits 29-16: Manufacturer ID

0-0FFF = VXI defined

1000-3FFF = VXi*plug&play* defined

- 3FFC = instrument drivers

- 3FFF = VISA

Bit 15: Published or internal status code

0 = published

1 = internal / undocumented

Bits 14-12: Reserved (always 0)

Bits 11-0: Unique sequence value

RULE 3.8.9

IF a vendor-specific extension includes attributes or status codes, **THEN** the numbers for those attributes and status codes **SHALL** be consistent with the coding scheme presented in Tables 3.8.1 and 3.8.2.

OBSERVATION 3.8.5

All VISA-defined attributes and status codes listed in Tables 3.3.1 and 3.4.1 are consistent with the coding scheme presented in Tables 3.8.1 and 3.8.2.

Appendix A Implementation Files
