

## Worksheet #2

Wednesday, January 7, 2026

Name:

## Questions (5 pts):

Consider a particle in an infinite potential well ( $V = 0$  for  $0 < x < L$  and  $V = \infty$  elsewhere). As you know, the eigenfunctions of the Hamiltonian for this system are given by (at  $0 < x < L$ )

$$\varphi_n(x) = \sqrt{\frac{2}{L}} \sin\left(\frac{\pi n x}{L}\right)$$

The particle is in a state described by some (normalized) wave function  $\Psi(x)$ .

**Write down the integrals** you would need to take to calculate the following:

- (a) The probability of finding the particle somewhere between 0 and  $L/2$
  
- (b) The coefficients  $c_n$  if you present  $\psi(x)$  as a superposition of eigenfunctions  $\varphi_n(x)$ ,  
i.e.  $\psi(x) = \sum_n c_n \varphi_n(x)$
  
- (c) You make a measurement of energy. What are the possible outcomes of the measurement? How do you decide which outcomes are likely or unlikely?
