

## INNER PRODUCTS

1. Let  $\vec{v} = v^1 \hat{i} + v^2 \hat{j}$  and  $\vec{w} = w^1 \hat{i} + w^2 \hat{j}$  be ordinary vectors in  $\mathbb{R}^2$ . Consider the inner product defined by

$$\vec{v} \star \vec{w} = \frac{1}{2} (v^1 w^2 + v^2 w^1)$$

- (a) Compute  $\vec{v} \star \vec{v}$ .
- (b) Using only your expression for  $\vec{v} \star \vec{v}$ , derive the expression above for  $\vec{v} \star \vec{w}$ .  
*Assume your expression holds for any vector  $\vec{v}$ . In particular, it holds for  $\vec{w}$ .*
- (c) Find a vector  $\vec{x} \in \mathbb{R}^2$  such that  $\vec{x} \star \vec{x} = 1$
- (d) Find a vector  $\vec{y} \in \mathbb{R}^2$  such that  $\vec{y} \star \vec{y} = -1$
- (e) How many independent vectors  $\vec{z} \in \mathbb{R}^2$  are there satisfying  $\vec{z} \star \vec{z} = 0$ ?
2. Now work in  $\mathbb{R}^3$ , and suppose there is an inner product such that

$$\vec{v} \star \vec{v} = v^1 v^2 + v^2 v^3 + v^3 v^1$$

- (a) Determine  $\vec{v} \star \vec{w}$ .
- (b) Find a basis of  $\mathbb{R}^3$  such that each basis vector  $\vec{u}$  satisfies either  $\vec{u} \star \vec{u} = 1$  or  $\vec{u} \star \vec{u} = -1$ , and any two basis vectors  $\vec{u}, \vec{v}$  satisfy  $\vec{u} \star \vec{v} = 0$ .

**EXTRA CREDIT:**

Using the above results, or otherwise, rewrite  $xy$  as the sum or difference of exactly two squares, and  $xy + yz + zx$  as the sum or difference of exactly three squares.
